This presentation describes the Literature Map application, which uses Web 2.0 concepts in the preparation of literature reviews for medical research. The application displays bibliographic references in a graphical manner. Publications are presented in order of publication, with citation links connecting interrelated publications. Different degrees of detail for each publication can be presented, thus allowing for different depths of understanding about the covered topic. Students are therefore able to quickly move from a general overview of the topic to specific comments on portions of the text for each scientific article.

**TECHNOLOGY USED**
- Java
- Tomcat
- Ajax
- MySQL
- Application is to be released under JPL

**OUTCOMES**
- This application is still in development.

**SPONSORS**
Partially sponsored by Duke CIT, since some of the insights to design this application were obtained during a study we are currently doing with medical students.
